Tensegrity
"All structures, properly understood, from the solar system to the atom are tensegrity structures" (Fuller, 1975).

Tensegrity, tensional integrity or floating compression, is a structural principle based on the use of isolated components in compression inside a net of continuous tension, in such a way that the compressed members (usually bars or struts) do not touch each other and the prestressed tensioned members (usually cables or tendons) delineate the system spatially.

Theme: Architecture, Engineering and Social Housing
The advantages of this architecture are:

- Safe
- Sustainable
- Ephemeral
- Easy and quick assembly.
- Ecological
- Dynamic
- Aseismic
- Lightweight
- Optimal Structural behavior

The following work was done in México at the Autonomous University of Puebla by Arq. Martin Abdi (2010).

Summaries in models and results

General Considerations:
This summary shows two of the models analyzed by Dr Noe Ilraola of Camaguey Cuba with some results from the stress-strain point of view. In the same way forward in modeling such structures is shown. The models can be adjusted to the extent that progress in the investigations of geometry and the inherent physical-mechanical materials the elements of the model property values are adjusted. This calibration process of theoretical models can be done by comparing with real models built on a reduced scale. This analysis may result in the possibility of using the theoretical model types spring elements, or tensioning cables.

Tensegrity Bamboo Architecture

It is done with the aim of showing a structure and space ecological, ephemeral, organic, innovative, clear, easy assembly, easy transportation, Lightweight structure, among other values to be recreational spaces between other various chores.

At present there is real demand for opting for alternative elements in materials and construction systems, so it is plausible to propose structural systems operating independently, they are inexpensive to mount and innovative show that structurally. Operate without the need for foundations and elements which are subject purely tensile and compression are then talking about a tensegrity structure. (Leonardo, 1992) Fitting a tensegrity structure with bamboo then it is an interesting combination to propose innovative experimental designs and also with economic and sustainable basis.
